Good morning,

The Pre-RD group is stationed at transect 7 (east bank RM 16.5) setting up equipment to begin high volume/high flow surface water sampling activities. The east and west banks have shallow water depths of approximately 7ft. One sample from each bank, and 3 sub-samples from the NAV channel will be collected to obtain a cumulative transect sample of 400L. Included are photos of health and safety items on board the RV Tieton and substation 7E location.

Jonni
